

AI-NATIVE DEV STACK WEBINAR

Accelerate AI-native infrastructure provisioning

In collaboration with

Available in AWS Marketplace

Agenda

Aaron Yang

*AI Product Manager,
StackGen*

Mansi Vaghela

*Sr. Solutions Architect,
Startups*

- 1 Controls that enable AI development at speed
- 2 How AWS and StackGen deliver production-grade AI
- 3 Aiden for InfraOps - demo
- 4 Next steps

Controls that enable AI development at speed

AI-Native Dev Stack with AWS and Partners

Mansi Vaghela

*Sr. Solutions Architect,
Startups*

The vibe-to-live gap

Anyone can vibe now. Building fast doesn't mean going live with confidence.

VIBE

Fast. AI-assisted. Accessible to everyone.

~45%

of AI-generated code
has security flaws

+23.5%

incidents per PR when quality
controls are not inline

+30%

change failure rates
without inline governance

6–100×

cost multiplier when bugs
escape to production

THE GAP

LIVE

Secure. Scalable. Reliable. Compliant.

Security at point of ingestion, not after the pull request (PR).

Infrastructure governed at creation, not audited later.

Observability injected as code is written.

Give teams cost visibility at every decision point.

Reliability defined in the spec before code exists.

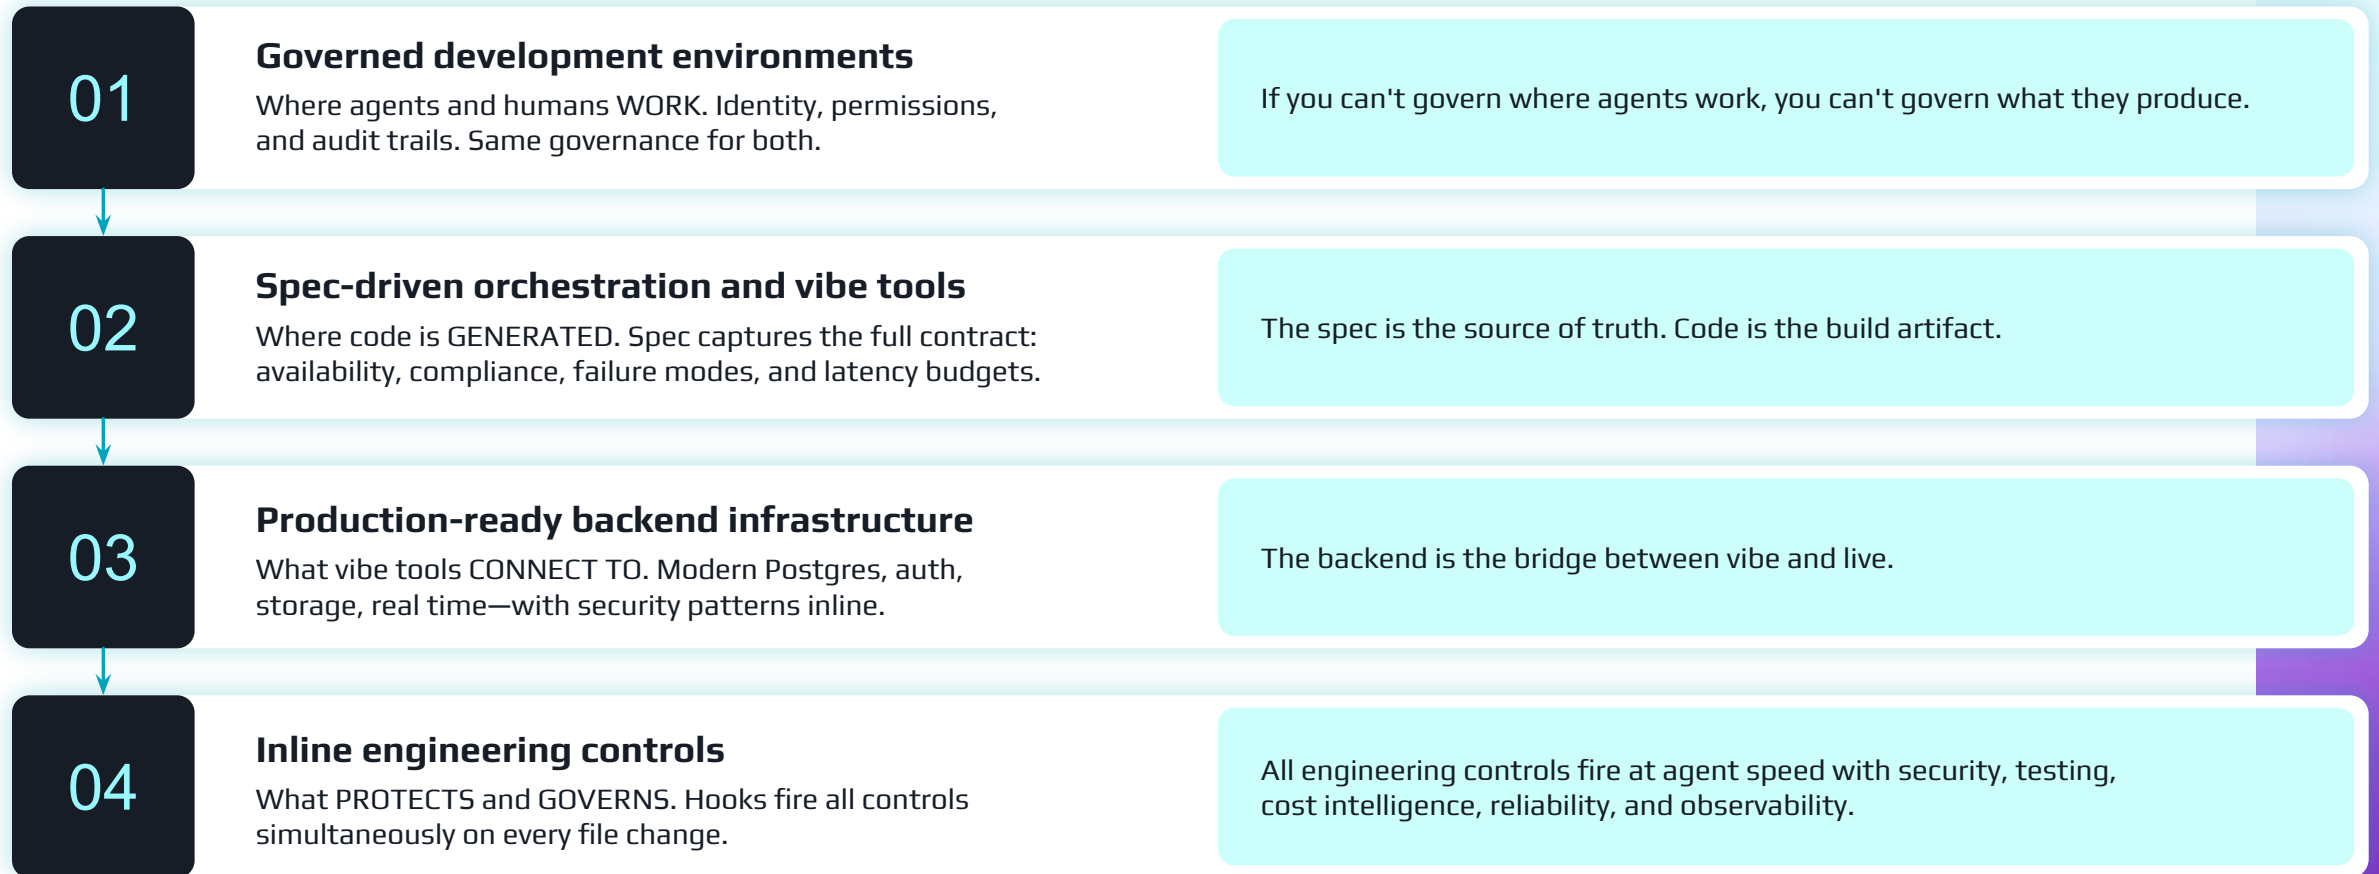

Compliance is continuous, not a periodic audit.

Backend services with inline security patterns.

This educational series shows how to close the gap, build securely, govern automatically, and ship confidently.

Embedded guardrails, not gates

The AI-Native Dev Stack: four-tier architecture

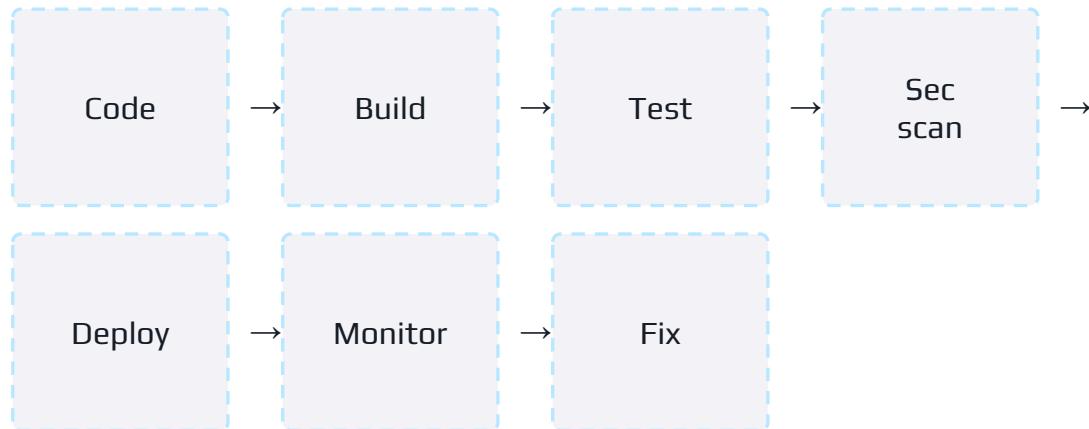

This is the structure. Controls that enable speed—not gates that block it.

Shift everywhere, not just left

How the stack BEHAVES. Not sequential phases, but simultaneous execution. Continuous verification.

THE OLD MODEL

Sequential pipeline. "Shift left" moves checks earlier

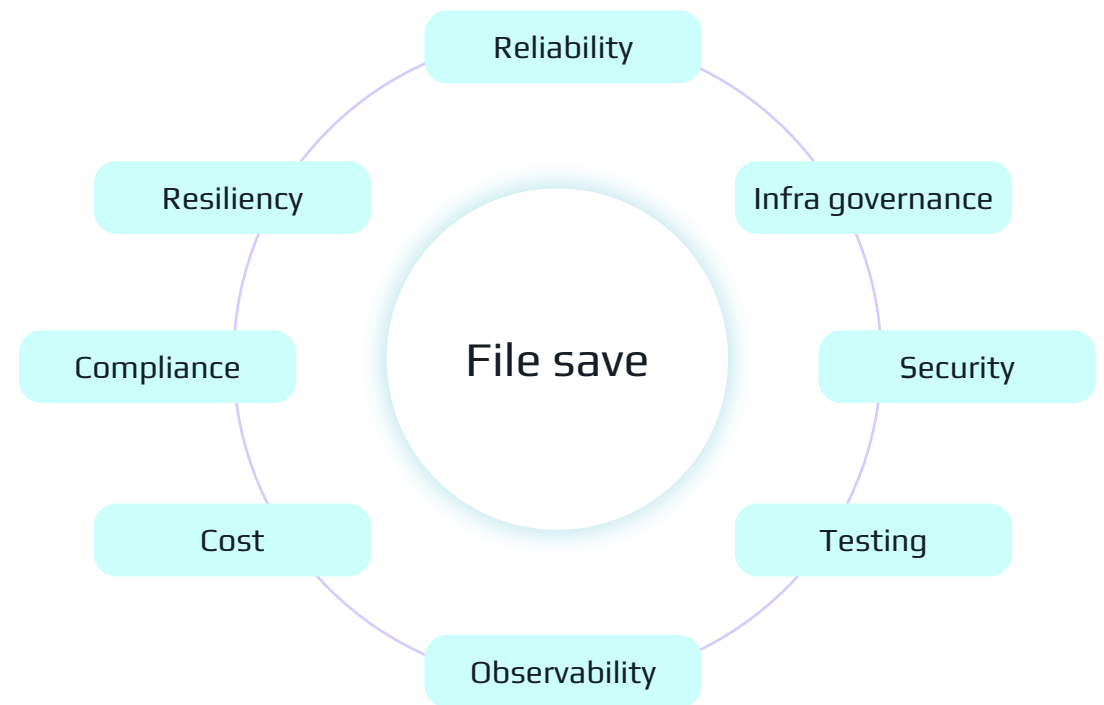

❑ Shift left = move checks this way ❑

PROBLEM:

Still assumes a linear flow. Security is still "outside" development and gets moved closer.

THE NEW MODEL

Event-driven. ALL controls fire simultaneously on every file change

The why

When speed outpaces governance

80%

of organizations report unclear AI ownership

46%

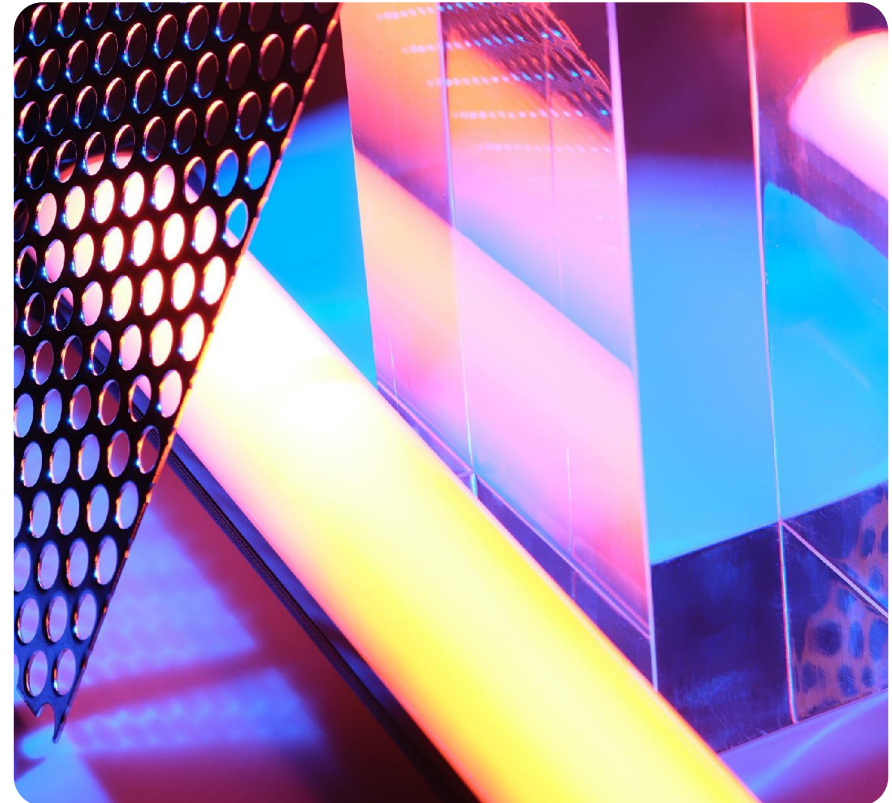

say governance gaps are the top reason for AI underperformance

3x

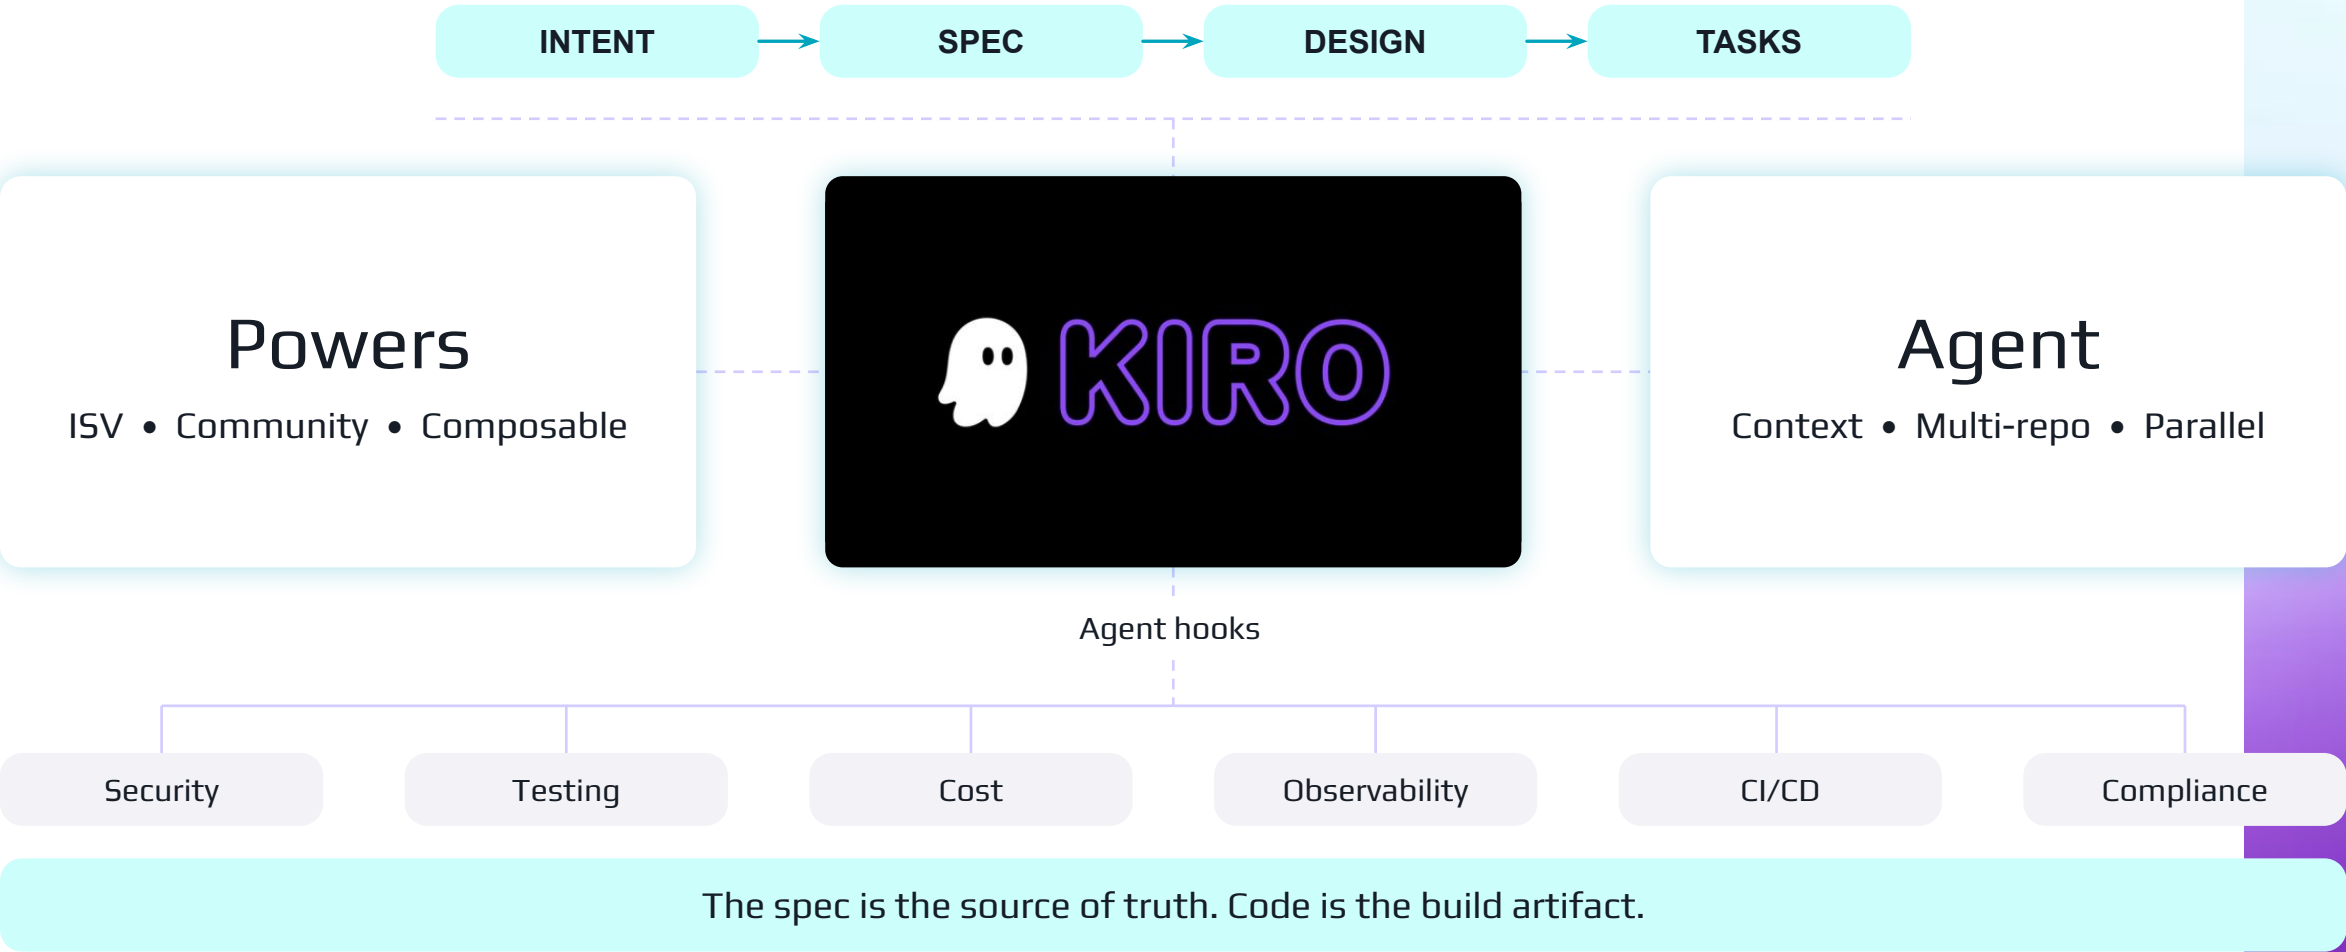

more likely to succeed with mature human-in-the-loop

50%+

deployed agents without defining boundaries

Kiro: spec-driven orchestration

How AWS and StackGen deliver AI native environments

Production grade, security, and governance

Aaron Yang

*AI Product Manager,
StackGen*

Velocity for developers, control for platform teams

StackGen and Kiro give line-of-business developers AI-native velocity and give platform teams the governance harness they need to approve it, across regulated verticals.

LOB DEVELOPERS AND LEADERS

Ship without the platform-team queue

Plain English application specifications become compliant, production-ready AWS infrastructure automatically, without leaving the IDE.

PLATFORM AND SRE TEAMS

Self-service they can actually trust

Compliance-by-default, shared state with drift detection, and a ServiceNow audit trail on every deployment.

Financial Services

The reference workload: regulated data on Amazon Relational Database Service (Amazon RDS), Amazon ElastiCache, Amazon Bedrock, AWS App Runner.

Insurance

Sensitive customer data with compliance gates enforced pre-production.

Retail

High-velocity teams shipping fast with PCI-DSS and Center for Internet Security (CIS) guardrails on.

Vertical SaaS

Consistent, governed infrastructure across every workspace deployment.

REGULATED BY DEFAULT AWS CIS Benchmarks enforced automatically, on every deployment.

MCP + A2A

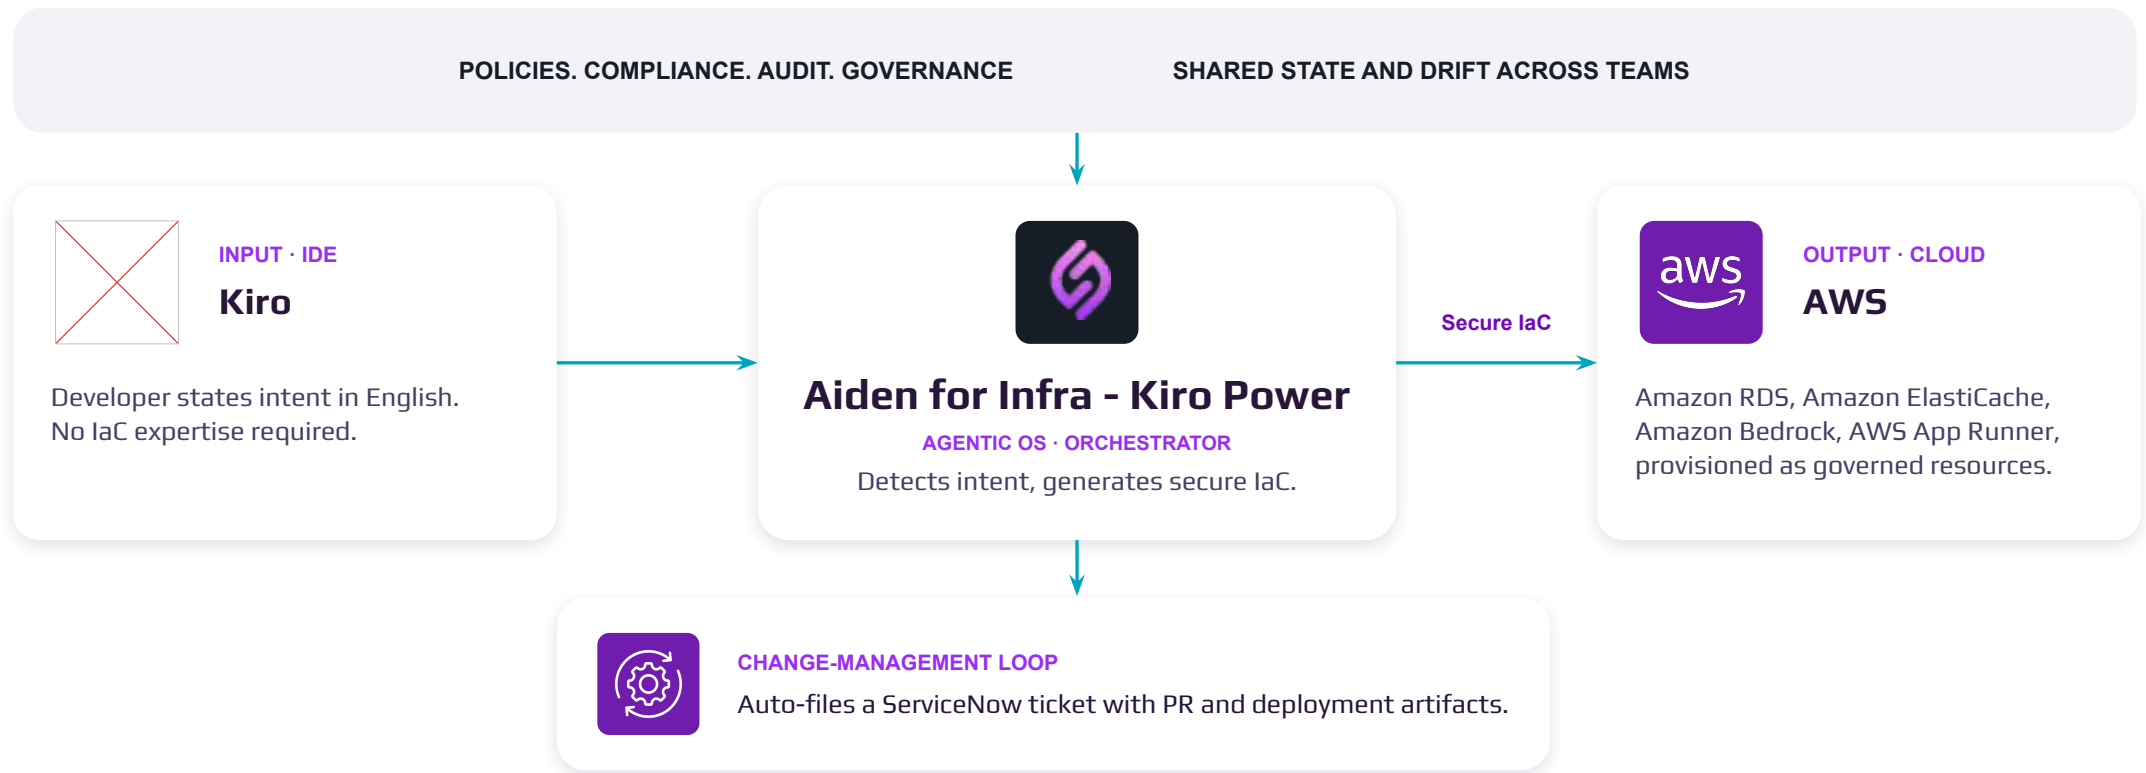

From intent/prompt to governed AWS infrastructure

A developer describes the intent to build an AI agent for financial services in Kiro. Aiden for Infrastructure Kiro Power turns that intent into compliant, production-ready infrastructure, with no platform-team handoff.

The enterprise self-service layer for infrastructure

Aiden sits between the Kiro IDE and the cloud, understanding developer intent, generating governed IaC, provisioning AWS, and closing the change-management loop.

Aiden for InfraOps: Kiro Power demo

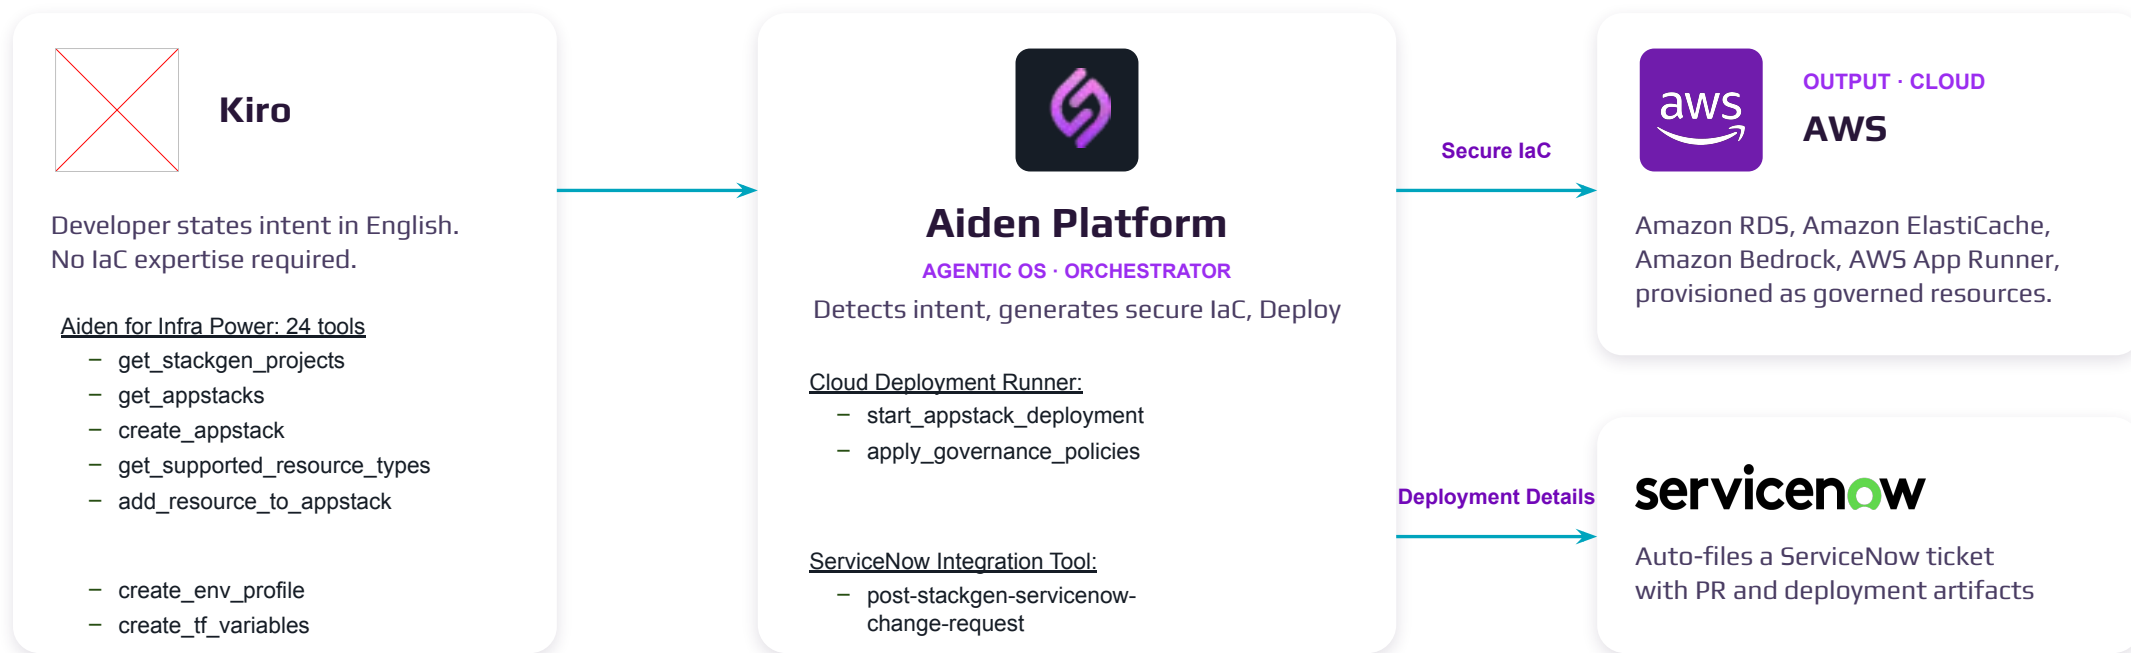

Aaron Yang

StackGen*

Demo

Aiden in action: demo

01

Workflow #1

As a platform engineer, set up infrastructure AppStack with compliance enabled using Aiden for Infrastructure deterministic workflows.

02

Workflow #2

As a developer, show Aiden for Kiro creating infrastructure required for a basic customer support AI agent using Amazon Bedrock.

03

Workflow #3

As a platform engineer, show how Aiden for Infrastructure automatically creates an audit of infrastructure deployment and any errors with root cause into ServiceNow.

04

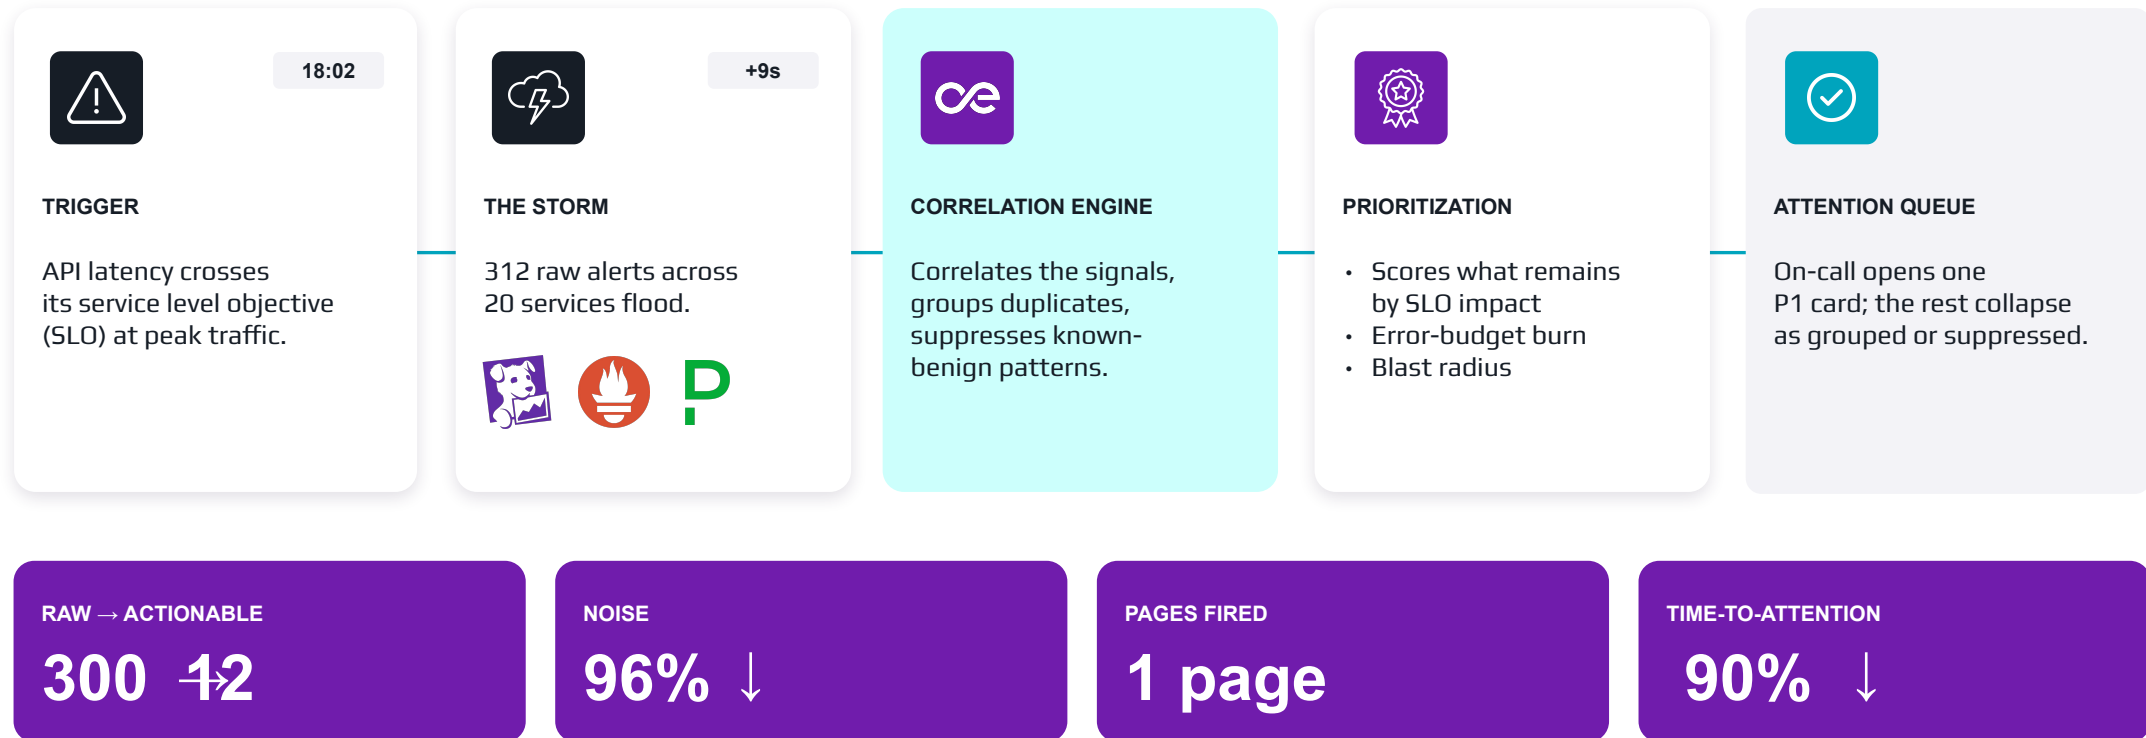

Workflow #4

Talk about our roadmap plan of including existing capability Aiden for Site Reliability Engineering (SRE) to be included as part of Aiden Power in an upcoming release.

Aiden for SRE - autonomous remediation

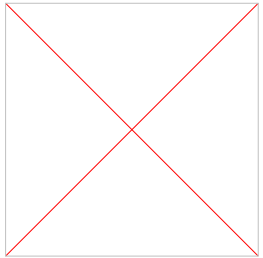

A shared dependency degrades at peak. Datadog, Prometheus, and PagerDuty light up across twenty services. The on-call still opens a single ranked incident.
