

The Autonomous DevOps Factory

Intent-driven Operations for delivering
Enterprise outcomes

Autonomous DevOps Factory

Aiden sets the foundations for an Autonomous DevOps Factory: build, govern, observe, and remediate the agent-driven SDLC so velocity and governance move in the same path.

Schedule demo

Every autonomous change needs a reviewable policy surface.

INTENT
State the outcome in plain language.
POLICY
Reviewable guardrails define approvals and escalation paths.
RUNTIME
Agents act fast, humans step in on novel cases with context.
LEARNING
Outcomes write back into shared memory for the next cycle.

Trusted by teams operating at enterprise scale.

Nielsen

Autodesk

Innovaccer

SAP NS2

Software creation now outpaces operations.

Agentic creation compounds change faster than teams can verify, govern, and ship it safely. The result is a widening gap between software creation and software operations.

New Relic 2026 State of AI Coding

DORA

AI helps productivity, hurts stability

DORA 2024 Accelerate State of DevOps Report

Autonomy should scale at the pace of confidence, not at the pace of autocomplete.

From intent to automated learning

The factory process turns operational intent into a reviewable runtime and learning loop. It is distinct from the four Aiden product pillars below.

01	Intent
	State the operational outcome in plain language.
02	Factory Spec
	Reviewable spec: agents, OCG data, SLOs, escalation boundaries.
03	Factory Runtime
	Agents execute; novel cases escalate to humans with full context.
04	Factory Learning
	Outcomes write back to the OCG and improve the next cycle.

Build, govern, observe, remediate.

Four states of one Agentic OS, with velocity and governance in the same path.

- 01 Build
- 02 Govern
- 03 Observe
- 04 Remediate

Aiden is the Agentic OS for DevOps.

Four surfaces for Platform Engineers, Developers, and SRE teams.

Infrastructure
Automation
Observability
SRE

Operational Context Graph

Topology, change, drift, causality, and observability live in one shared memory layer.

Topology
What is running, where it lives, and how it connects.
Change
What changed, by whom, and when it landed.
Drift
What moved away from the intended state.
Causality
What explains the incident chain and blast radius.
Observability
What the system is signaling right now.

Platform goes deeper: shared memory separates a factory from a pile of agents.

Scale autonomy with governance in the same path.

Aiden is the Agentic OS for DevOps. Schedule a demo to see build, govern, observe, and remediate under one operating system.

Schedule demo

AGENTIC OS

Agentic OS for DevOps

Aiden runs on one platform for Platform Engineers, Developers, and SRE teams: build, operate, monitor, and heal multi-cloud production for applications and AI agents, with guardrails baked in.

Deterministic plane plus agentic plane. Shared Operational Context Graph. Tirith at every action boundary.

[Schedule demo](#)

Deterministic plane

AppStacks, Terraform/OpenTofu, Tirith policy, topology. Reviewable and replayable.

Agentic plane

Aiden surfaces across Infrastructure, Automation, Observability, and SRE. Cross-domain plays share one context graph.

Operational Context Graph

The OCG connects operational domains into a queryable graph. That is what separates a factory from a collection of agents.

Aiden OS

Aiden OS coordinates how work moves between agents, when humans re-enter the loop, and how cost stays inside policy.

Workflow orchestration

Sequences multi-agent work with escalation to humans when bounds are hit.

Financial governance

Tracks inference and cost guardrails so autonomy stays inside budget policy.

Roadmap

Early Access and H1 2027 items are not GA.

Currently Available: Aiden for Automation · Aiden for SRE

Early Access: Aiden for Infrastructure · ADF factory generation

H1 2027: MLOps Factory

ADF LOOP · BUILD

Aiden for Infrastructure

Intent becomes policy-checked infrastructure change. Build with governance at every action boundary.

Part of the Agentic OS for DevOps. IaC tooling alone stops at templates. Aiden keeps Build inside the full loop.

[Schedule demo](#)

10×

provisioning velocity

100%

policy-checked deploys

95%

less IaC toil

60%

lower IaC cost

Intent becomes infrastructure change inside policy.

Aiden for Infrastructure turns plain-language outcomes into a Factory Spec, generates a reviewable plan, and applies only the bounded change your controls allow.

Intent input

Teams describe the operational outcome in plain language instead of stitching the IaC path together by hand.

Policy boundary

Every proposed change is checked against the governance threshold you configured before apply.

Intent

Plain-language intent

An operator states the target state or migration outcome in plain language.

FactorySpec

Factory Spec assembled

A reviewable spec defines agents, topology inputs, SLOs, and governance requirements.

Plan

Policy-checked plan reviewed

A diffable infrastructure plan is generated and bounded before execution.

Apply

Change lands under guardrails

Only the validated change is provisioned, with approvals added where the limit requires.

Watch

Watch

Drift detection and baseline checks keep the environment aligned after the change lands.

Rollback

Threshold rollback stays close

If live thresholds breach, rollback can trigger from the bounded change set without rebuilding context.

Tirith evaluates each action boundary; drift detection keeps rollback close after apply.

EARLY ACCESS

Policy-bounded migration

Drift detection, baseline audits, and threshold rollbacks keep live workloads in transit inside policy.

ADF LOOP · OPERATE

Aiden for Automation

Pipeline-native delivery with governance in the path. Operate and maintain without the ticket tax.

Part of the Agentic OS for DevOps. Maps to the Operate pillar in the ADF loop.

Schedule demo

~30%

fewer pipeline tickets

Pre

deploy infra checks

Canary

gates on release

Auto

rollback on breach

Pipelines that verify before they promote.

Aiden for Automation checks build output against live infrastructure context, gates risky changes, and confirms the release behaves after ship.

Active Gating

Checks current infrastructure state against historical failure patterns in the OCG before promotion.

Self-Verification

Deployments verify themselves through post-release monitoring so drift and regressions surface immediately.

Commit

Code commit

A source change lands in Git and starts the delivery path.

BuildTest

Build and test

Linting, security scans, unit tests, and packaging validate the release artifact.

OCGCheck

Infra checks against OCG

Live topology, recent drift, and failure history are queried before the pipeline can promote.

Gate

Active gating

Unsafe releases halt when the current estate matches a risky pattern in the graph.

Deploy

Deploy

The validated release provisions only the required change and keeps rollback close.

Monitor

Monitoring confirms release health

Telemetry checks confirm the service stays inside SLO and the deploy does not introduce fresh drift.

The OCG supplies shared failure history; monitoring closes the loop after every deploy.

See governed pipelines on your stack.

Schedule demo

ADF · LOOP · OBSERVE

Aiden for Observability

Unified signal and AI-assisted insight that feeds Remediate. Natural language instead of dashboard archaeology.

Part of the Agentic OS for DevOps. Observe feeds Remediate with correlated context.

Schedule demo

60%+

lower observability cost

90%

fewer O11Y tickets (greythHR)

300+

integrations

PromQL

native, no rewrite

Ask production in plain language.

greythHR used Aiden to replace complex queries with natural language insights and cut observability support tickets by 90 percent. The OCG links live signals to infrastructure state and change history before SRE takes over.

See Observability with Aiden.

Schedule demo

ADF LOOP · REMEDIATE

Aiden for SRE

Detect, triage, diagnose, and remediate within policy. Heal inside your SLOs.

Part of the Agentic OS for DevOps. SRE-domain tools stop at one domain. Aiden remediates inside the same OS that builds and observes.

Schedule demo

50%

MTTR reduction

66%

faster RCA

90%

less alert noise

10 to 15

hrs/week per SRE

Move from drift to recovery inside policy.

Aiden for SRE correlates alert signals with OCG history, generates the remediation, and ships it only when the policy boundary passes.

Workflow orchestration sequences steps; policy enforces each action boundary.

See bounded remediation on your stack.

Schedule demo

SOLUTIONS

Motions for Platform and SRE

Three GTM paths into the Agentic OS. Pick the motion that matches how you buy and operate today.

Schedule demo

MOTION A

Governed infrastructure

Intent becomes policy-checked Terraform and OpenTofu change. Contrast: IaC tooling alone.

MOTION B

Autonomous DevOps Factory

Full loop under one Agentic OS: build, govern, observe, remediate. Launch north star.

MOTION C

SRE reliability

Detect, diagnose, and remediate inside policy bounds. Contrast: SRE-domain-only tools.

Wave B stub. Full Solutions IA deferred until motions need dedicated landing depth.

COMPANY

StackGen is the company behind Aiden

The DevOps operating system for AI-native environments. Aiden serves Platform Engineers, Developers, and SRE teams.

Schedule demo

Aiden is the Agentic OS for DevOps for Platform Engineers, Developers, and SRE teams to build, operate, monitor, and heal production multi-cloud environments for applications and AI agents, with guardrails baked in and without organizational silos or vendor lock-in. Where other vendors stop at writing code or managing infrastructure, StackGen spans the entire production journey.

Aiden sets the foundations for an Autonomous DevOps Factory: build, govern, observe, and remediate the agent-driven SDLC so velocity and governance move in the same path.
