

Reactive SRE Fails to Solve the On-Call Crisis

Systemic bottlenecks and failure modes in modern incident response

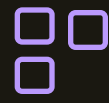

Extended MTTR:

Average P1 incidents take 4 hours to resolve, with the first 90 minutes spent just agreeing on the broken component.

Burnout:

The chaos of incomplete context during on-call rotations is the leading cause of engineer attrition.

Fragmented Archaeology:

Root Cause Analysis (RCA) is a week-long project spanning six disconnected tools.

Blind Spots:

Most AI SRE tools lack visibility into the infrastructure changes and deployment events that cause the majority of incidents.
