

Stateless Domain Agents Fail to Solve Cross-Domain Problems

The velocity of software production is higher than ever, creating a paradox where code is written faster than it can be reliably and safely shipped.

The Domain Silos

Engineering teams have excellent tools, but these domains operate in absolute isolation.

CI/CD Pipelines

Deployment loops run automatically but lack infrastructure visibility

Infrastructure Automation

Provisioning runs in isolation, producing undetected manual drift.

Observability Stack

Metrics track real-time health, detached from the system change history.
