High-resolution export · Light Mode, then Dark Mode

Light Mode

Autonomous DevOps Factory

Aiden sets the foundations for an Autonomous DevOps Factory: build, govern, observe, and remediate the agent-driven SDLC so velocity and governance move in the same path.

StackGen is the company behind Aiden, the DevOps operating system for AI-native environments. Platform and SRE leaders scale autonomy at the pace their confidence supports.

Get started

Garnter Cool Vendor in AI for IT Operations - Named in four Gartner Hype Cycles - AWS Advanced Technology Partner - Google Cloud Partner

EVERY SURFACE

One graph. Every surface your team already uses.

01	CLI	Run Aiden actions from the terminal, right where infra code already lives.
02	IDE via MCP	Governed Aiden tools inside Cursor and VS Code without leaving the editor.
03	Git	Every change lands as a reviewable pull request in your own repository.
04	Slack	Approvals and remediation updates land where the on-call team already watches.
05	Jira / Linear	Assign a ticket and Aiden picks up the context and reports back on it.
06	API	Programmatic access for automation that does not fit a chat window.

Software creation now outpaces operations.

Agentic creation compounds change faster than teams can verify, govern, and ship it safely. The result is a widening gap between software creation and software operations.

1.7x

more issues in AI-generated PRs
Independent analysis found AI-authored pull requests carry more defects, especially logic and correctness bugs that become production incidents.
CodeRabbit / Stack Overflow Blog, State of AI vs Human Code Generation

78%

report more incidents once AI code is live
Teams rate AI code highly in review, then see production failures after ship when line-by-line review is skipped.
New Relic 2026 State of AI Coding

DORA

AI helps productivity, hurts stability
AI adoption raises individual productivity while hurting software delivery stability and throughput.
DORA 2024 Accelerate State of DevOps Report

Autonomy should scale at the pace of confidence, not at the pace of autocomplete.

From intent to automated learning

The factory process turns operational intent into a reviewable runtime and learning loop.

Build, Operate, Observe, Remediate.

Aiden sets the foundations for an Autonomous DevOps Factory. Four states of one Agentic OS, with velocity and governance in the same path.

Aiden from StackGen is the Agentic OS for DevOps.

Four surfaces for Platform Engineers, Developers, and SRE teams: Infrastructure, Automation, Observability, and SRE. Guardrails backed in. No organizational silos.

Aiden for Infrastructure Stop choosing between fast and compliant. 10x provisioning velocity: minutes, not days 100% of deploys policy-checked 95% less IaC toil 60% lower IaC cost ✓ AI IDE-based infra creation via MCP ✓ Producer / consumer model ✓ Cloud discovery and cloud-to-code ✓ Continuous drift detection and remediation Explore Aiden for Infrastructure →	Aiden for Automation Pipelines that check themselves before they ship. ~50% fewer pipeline tickets Pre deploy infrastructure checks Canary gates on every release Auto rollback on breach ✓ Self-verifying, drift-aware pipelines ✓ Pre-deploy infrastructure validation ✓ Canary gates and auto-rollback ✓ GitOps-native Explore Aiden for Automation →	Aiden for Observability Your monitoring stack shouldn't need its own on-call. 60%+ lower observability cost 2 to 5 SRE FTEs reclaimed 300+ integrations PromQL native, no rewrite ✓ Unified metrics, logs, traces and APM ✓ Drop-in Prometheus remote-write ✓ Open standards, managed OTel stack ✓ SLO management built in Explore Aiden for Observability →	Aiden for SRE Less toil. Faster recovery. Your SREs, amplified. 50% MTTR reduction 66% faster root cause analysis 90% less alert noise 10 to 15 hrs/week reclaimed per SRE ✓ Automatic service discovery ✓ SLO-based alert triage ✓ Evidence-backed root cause analysis ✓ Human-approved remediation Try Aiden for SRE in action →
---	--	--	--

All four surfaces share one Operational Context Graph.

Operational Context Graph

Topology, change, drift, causality, and observability live in one shared memory layer, allowing Aiden surfaces to act like one unified system.

Topology	Change	Drift	Causality	Observability
What is running, where it lives, and how it connects.	What changed, by whom, and when it landed.	What moved away from the intended state.	What explains the incident chain and blast radius.	What the system is signaling right now.

Platform goes deeper: shared memory separates a factory from a pile of agents.

Stack-agnostic, by design.

StackGen runs on top of the tools your team already uses. No rip-and-replace, no proprietary lock-in.

IaC	Generate in the language you already use.					
Terraform	OpenTofu	Helm	CloudFormation			
CI / CD						
Ship through your existing pipelines.						
GitHub	GitLab	Bitbucket	Jenkins	Argo CD		
Observability						
Read every signal you already collect.						
Grafana	Prometheus	Loki	Jaeger	OpenTelemetry	Datadog	New Relic
Security & Identity						
Use the policy and identity you trust.						
Wiz	HashiCorp Vault	Okta	OPA			
ChatOps & ITSM						
Slot into your incident workflow.						
PagerDuty	Slack	ServiceNow			Jira	
IDEs & MCP clients						
Aiden lives where your developers live.						
VS Code	Cursor	Amazon Kiro	Claude Code	Backstage		

Built with the teams running it.

GREYTHR Aiden transformed how our engineers interact with observability. Natural language insights replaced complex queries and reduced dependency on SREs. Abhishek Gaurav HEAD OF ENGINEERING AND DEVOPS	NIELSEN Agents were shipping recommendations faster than our governance could absorb. Aiden put policy and audit on the same path as change. PLACEHOLDER VP PLATFORM ENGINEERING	INNOVACER Deployment used to take days of cloud-specific glue. Environments now land in under a day, aligned to the controls healthcare requires. PLACEHOLDER CLOUD PLATFORM LEAD	HEALTHCARE PLATFORM Every root cause comes back with its sources attached. My engineers stopped arguing about what happened and started arguing about what to do next. [NAME] PRINCIPAL SRE
---	---	--	--

INDUSTRIES

Proven where the evidence is real.

Financial services 53,000 deployments a week, 24% rework, at one leading Latin American bank.	Healthcare Innovaccer runs governed infrastructure change on Aiden today.
---	---

More verticals as evidence lands. We do not publish a case we cannot prove.

Autonomy needs guardrails.

Every Aiden action runs through policy at runtime, not as a static gate. Every decision logged. Every approval routed where it should go. That is what makes autonomous DevOps safe to run.

Policy enforcement	Audit trail	Approval workflow	Organisational knowledge
Runtime policy checks on every action before it executes.	Every Aiden action, decision, and tool call logged and queryable. Compliance-ready out of the box.	Route to humans where it matters. Set thresholds by environment, blast radius, or cost.	Runbooks, modules, incident signatures. Versioned, approved, and consumable by every agent.

SDC 2	PCI	HIPAA
-------	-----	-------

WHAT RUNS AUTONOMOUSLY

Bounded autonomy, four pillars.

01	02	03	04
Build	Govern	Observe	Remediate
Intent becomes policy-checked Terraform in your Git. Aiden for Infrastructure.	Pipelines gate on Operational Context Graph checks before merge. Aiden for Automation.	Signals correlate to change history and infra state. Aiden for Observability.	Incidents investigate with shared context, then act inside policy. Aiden for SRE.

Recommend, approve, act within policy. Refuse when the limit you drew is crossed.

Scale autonomy with governance in the same path.

Aiden is the Agentic OS for DevOps for Platform Engineers, Developers, and SRE teams. Schedule a demo to see build, govern, observe, and remediate under one operating system.

ADF LOOP · BUILD

Aiden for Infrastructure

Intent becomes policy-checked infrastructure change. Build with governance at every action boundary.

Part of the Agentic OS for DevOps. IaC tooling alone stops at templates. Aiden keeps Build inside the full loop.

Get started

10×

provisioning velocity

100%

policy-checked deploys

95%

less IaC toil

60%

lower IaC cost

KEY CAPABILITIES

Intent to Terraform

State the outcome in plain language. Aiden drafts policy-checked Terraform.

Your Git, always

Every change lands as a reviewable pull request in your own repository.

Cloud to code

Discover live cloud state and normalize it into AppStacks without a rewrite.

Intent becomes infrastructure change inside policy.

Aiden for Infrastructure turns plain-language outcomes into a Factory Spec, generates a reviewable plan, and applies only the bounded change your controls allow.

Intent input

Teams describe the operational outcome in plain language instead of stitching the IaC path together by hand.

Policy boundary

Every proposed change is checked against the governance threshold you configured before apply.

Intent

Plain-language intent

An operator states the target state or migration outcome in plain language.

FactorySpec

Factory Spec assembled

A reviewable spec defines agents, topology inputs, SLOs, and governance requirements.

Plan

Policy-checked plan reviewed

A diffable infrastructure plan is generated and bounded before execution.

Apply

Change lands under guardrails

Only the validated change is provisioned, with approvals added where the limit requires.

Watch

Watch

Drift detection and baseline checks keep the environment aligned after the change lands.

Rollback

Threshold rollback stays close

If live thresholds breach, rollback can trigger from the bounded change set without rebuilding context.

Tirth evaluates each action boundary; drift detection keeps rollback close after apply.

EARLY ACCESS

Policy-bounded migration

Drift detection, baseline audits, and threshold rollbacks keep live workloads in transit inside policy.

Request access

ADF LOOP · OPERATE

Aiden for Automation

Pipeline-native delivery with governance in the path. Operate and maintain without the ticket tax.

Part of the Agentic OS for DevOps. Maps to the Operate pillar in the ADF loop.

Get started

~30%

fewer pipeline tickets

Pre

deploy infra checks

Canary

gates on release

Auto

rollback on breach

KEY CAPABILITIES

Pipeline gating

Every pipeline step checks against the Operational Context Graph before it proceeds.

No blind merges

Active gating stops a merge the moment context says it is unsafe.

Self-verification

Automation checks its own output before marking a task complete.

Pipelines that verify before they promote.

Aiden for Automation checks build output against live infrastructure context, gates risky changes, and confirms the release behaves after ship.

Active Gating

Checks current infrastructure state against historical failure patterns in the Operational Context Graph before promotion.

Self-Verification

Deployments verify themselves through post-release monitoring so drift and regressions surface immediately.

Commit

Code commit

A source change lands in Git and starts the delivery path.

BuildTest

Build and test

Linting, security scans, unit tests, and packaging validate the release artifact.

OCGCheck

Infra checks against context graph

Live topology, recent drift, and failure history are queried before the pipeline can promote.

Gate

Active gating

Unsafe releases halt when the current estate matches a risky pattern in the graph.

Deploy

Deploy

The validated release provisions only the required change and keeps rollback close.

Monitor

Monitoring confirms release health

Telemetry checks confirm the service stays inside SLO and the deploy does not introduce fresh drift.

The Operational Context Graph supplies shared failure history; monitoring closes the loop after every deploy.

CUSTOMER

PLACEHOLDER – quote pending approval

No customer quote ships here until it clears the approval tracker.

ADF LOOP · OBSERVE

Aiden for Observability

Unified signal and AI-assisted insight that feeds Remediate. Natural language instead of dashboard archaeology.

Part of the Agentic OS for DevOps. Observe feeds Remediate with correlated context.

Get started

60%+

lower observability cost

90%

fewer O11Y tickets (greythR)

300+

integrations

PromQL

native, no rewrite

KEY CAPABILITIES

Signal correlation

Metrics, logs, and traces resolve against real infra state and change history.

Natural-language queries

Ask what changed in plain language. Aiden traces the correlated cause.

Handoff to SRE

A correlated insight becomes an SRE investigation without a context reset.

Ask production in plain language.

greythR used Aiden to replace complex queries with natural language insights and cut observability support tickets by 90 percent. The Operational Context Graph links live signals to infrastructure state and change history before SRE takes over.

CUSTOMER

“The correlated view is what let us trust the alert instead of re-verifying it by hand.”

Abhishek Gaurav, Head of Engineering and DevOps, greythR

See Observability with Aiden.

Schedule demo

ADF LOOP · REMEDIATE

Aiden for SRE

Detect, triage, diagnose, and remediate within policy. Heal inside your SLOs.

Part of the Agentic OS for DevOps. SRE-domain tools stop at one domain. Aiden remediates inside the same OS that builds and observes.

Get started

50%

MTTR reduction

66%

faster RCA

90%

less alert noise

10 to 15

hrs/week per SRE

KEY CAPABILITIES

Shared investigation context

Every incident opens with topology, change history, and prior remediations attached.

Policy-bound remediation

Aiden acts only inside the limits your change advisory board approved.

Verification, not just action

Every remediation confirms the fix before closing the loop.

Move from drift to recovery inside policy.

Aiden for SRE correlates alert signals with Operational Context Graph history, generates the remediation, and ships it only when the policy boundary passes.

Infrawatch

Infra drift present

Live infrastructure drifts from desired state and is scored as incident-relevant.

ChangeCorrelation

P1 alert fires

Alert signals are linked back to the risky change and affected service path.

RootCause

Root cause via context graph

Shared topology, change history, and observability context isolate the failing dependency.

Remediation

Remediation generated

A safe infrastructure fix is proposed from the incident context instead of a blank runbook.

Deploy

Policy-validated deploy

The change runs only after policy passes at the action boundary you configured.

Verification

Verification / SLO recovered

Recovery is confirmed, the incident path closes, and the service returns inside SLO.

Workflow orchestration sequences steps; policy enforces each action boundary.

CUSTOMER

PLACEHOLDER — quote pending approval

No customer quote ships here until it clears the approval tracker.

See bounded remediation on your stack.

AGENTIC OS

Agentic OS for DevOps

Aiden runs on one platform for Platform Engineers, Developers, and SRE teams: build, operate, monitor, and heal multi-cloud production for applications and AI agents, with guardrails baked in.

Deterministic plane plus agentic plane. Shared Operational Context Graph. Tirith at every action boundary.

Get started

Running in production across regulated and high-scale environments.

BY THE NUMBERS

10×

velocity

Infrastructure change ships as fast as the policy check clears.

100%

policy-checked deploys

Every change evaluates against Tirith before it lands.

95%

less IaC toil

Manual Terraform authoring drops once intent drives the spec.

60%

lower IaC cost

Fewer stale modules, less rework, less duplicated state.

Deterministic plane

AppStacks, Terraform/OpenTofu, Tirith policy, topology. Reviewable and replayable.

Agentic plane

Aiden surfaces across Infrastructure, Automation, Observability, and SRE. Cross-domain plays share one context graph.

Operational Context Graph

The Operational Context Graph connects operational domains into a queryable graph. That is what separates a factory from a collection of agents.

Aiden OS

Aiden OS coordinates how work moves between agents, when humans re-enter the loop, and how cost stays inside policy.

Workflow orchestration

Sequences multi-agent work with escalation to humans when bounds are hit.

Financial governance

Tracks inference and cost guardrails so autonomy stays inside budget policy.

Roadmap

---	--	---	---

MODEL

Platform fee plus tiered usage.

Sales-led packaging matched to your environment. No public dollar figures — a quote lands after we map your operating constraints.

Platform fee

Base access to Aiden OS, Operational Context Graph, and policy evaluation.

Tiered usage

Scales with governed actions, surfaces in use, and environment count.

Hybrid delivery

SaaS by default. On-prem and air-gapped available for regulated teams.

PUBLIC WEB RULES

No modeled ROI dollars on this page.

Slide-style annual value figures stay in sales materials until finance and analyst-relations sign-off. This page sells the packaging shape, not a spreadsheet.

FAQ

What buyers ask before a quote.

Do you publish list prices?

No. Pricing is scoped after a demo against your surfaces, policy posture, and delivery model.

Can we run air-gapped?

Yes for regulated teams. Hybrid delivery is part of the packaging conversation.

What is included in the platform fee?

Aiden OS runtime, Operational Context Graph, Tirith policy checks, and the four Aiden surfaces you enable.

☒

Add auth-service latency and timeout specific monitors, not just aggregate api-gateway error rate.

long-term

Bottom line of step 1

Relevant metrics, logs, spans, and events all converge on a deployment-correlated auth timeout regression path in api-gateway, with downstream auth-service /validate calls timing out and causing widespread 503s on GET /api/v1/resources, which is what tripped the API Error Rate monitor.

User follow-up required

Do you want Aiden to create a ServiceNow incident for this outage and include the RCA details above?

☒ Yes

☐ No

If yes, please provide the ServiceNow configuration name if your org has more than one configured environment, otherwise I'll use the existing/default configuration.

Schedule demo

ADF LOOP · REMEDIATE

Aiden for SRE

Detect, triage, diagnose, and remediate within policy. Heal inside your SLOs.

Part of the Agentic OS for DevOps. SRE-domain tools stop at one domain. Aiden remediates inside the same OS that builds and observes.

KEY CAPABILITIES

Shared investigation context
Every incident opens with topology, change history, and prior remediations attached.

Policy-bound remediation
Aiden acts only inside the limits your change advisory board approved.

Verification, not just action
Every remediation confirms the fix before closing the loop.

Move from drift to recovery inside policy.

Aiden for SRE correlates alert signals with Operational Context Graph history, generates the remediation, and ships it only when the policy boundary passes.

●

Infrawatch

Infra drift present
Live infrastructure drifts from desired state and is scored as incident-relevant.

●

ChangeCorrelation

P1 alert fires
Alert signals are linked back to the risky change and affected service path.

●

RootCause

Root cause via context graph
Shared topology, change history, and observability context isolate the failing dependency.

●

Remediation

Remediation generated
A safe infrastructure fix is proposed from the incident context instead of a blank runbook.

●

Deploy

Policy-validated deploy
The change runs only after policy passes at the action boundary you configured.

●

Verification

Verification / SLO recovered
Recovery is confirmed, the incident path closes, and the service returns inside SLO.

Workflow orchestration sequences steps; policy enforces each action boundary.

AGENTIC OS

Agentic OS for DevOps

Aiden runs on one platform for Platform Engineers, Developers, and SRE teams: build, operate, monitor, and heal multi-cloud production for applications and AI agents, with guardrails baked in.

Deterministic plane plus agentic plane. Shared Operational Context Graph. Tirith at every action boundary.

Get started

Running in production across regulated and high-scale environments.

BY THE NUMBERS

10×

velocity
Infrastructure change ships as fast as the policy check clears.

100%

policy-checked deploys
Every change evaluates against Tirith before it lands.

95%

less IaC toil
Manual Terraform authoring drops once intent drives the spec.

60%

lower IaC cost
Fewer stale modules, less rework, less duplicated state.

Deterministic plane

AppStacks, Terraform/OpenTofu, Tirith policy, topology. Reviewable and replayable.

Agentic plane

Aiden surfaces across Infrastructure, Automation, Observability, and SRE. Cross-domain plays share one context graph.

Operational Context Graph

The Operational Context Graph connects operational domains into a queryable graph. That is what separates a factory from a collection of agents.

Aiden OS

Aiden OS coordinates how work moves between agents, when humans re-enter the loop, and how cost stays inside policy.

Workflow orchestration

Sequences multi-agent work with escalation to humans when bounds are hit.

Financial governance

Tracks inference and cost guardrails so autonomy stays inside budget policy.

Roadmap

Currently Available: Aiden for Automation · Aiden for SRE

Early Access: Aiden for Infrastructure · ADF factory generation

MLOps Factory

Four surfaces. One OS.

See the Agentic OS on your stack.

One platform for Platform Engineers, Developers, and SRE teams — build, operate, and heal with guardrails baked in.

Schedule demo

ENTERPRISE

Build for the enterprise from day one.

Security, compliance, and control are not afterthoughts. Every Aiden surface ships policy-checked, audited, and governable.

10×

velocity
Infrastructure change ships as fast as the policy check clears.

100%

policy-checked
Every change evaluates against Tirith before it lands.

50%

MTTR reduction
Shared context skips the manual correlation step.

60%+

lower cost
Correlation replaces redundant dashboards and alert noise.

BUILT FOR SCALE

Every feature ships enterprise-ready.

SSO / SAML

Single sign-on with every major identity provider.

Centralized org config

One policy surface across every environment.

Cost controls

Guardrails on inference and infra spend, enforced by policy.

OTEL native

Standard telemetry export, no proprietary agent.

Air-gapped delivery

On-prem and disconnected environments supported.

Dedicated environments

Isolated compute and data boundaries per customer.

COMPLIANCE

Enterprise trust, built in.

SOC 2

PCI

HIPAA

“The correlated view is what let us trust the alert instead of re-verifying it by hand.”

MODEL

Platform fee plus tiered usage.

Sales-led packaging matched to your environment. No public dollar figures — a quote lands after we map your operating constraints.

Platform fee

Base access to Aiden OS, Operational Context Graph, and policy evaluation.

Tiered usage

Scales with governed actions, surfaces in use, and environment count.

Hybrid delivery

SaaS by default. On-prem and air-gapped available for regulated teams.

PUBLIC WEB RULES

No modeled ROI dollars on this page.

Slide-style annual value figures stay in sales materials until finance and analyst-relations sign-off. This page sells the packaging shape, not a spreadsheet.

FAQ

What buyers ask before a quote.

Do you publish list prices?

No. Pricing is scoped after a demo against your surfaces, policy posture, and delivery model.

Can we run air-gapped?

Yes for regulated teams. Hybrid delivery is part of the packaging conversation.

What is included in the platform fee?

Aiden OS runtime, Operational Context Graph, Tirith policy checks, and the four Aiden surfaces you enable.

NEWS

News and momentum.
